How an option contract is executed?

Source: Kannavis iTrade

Company sends in order request:

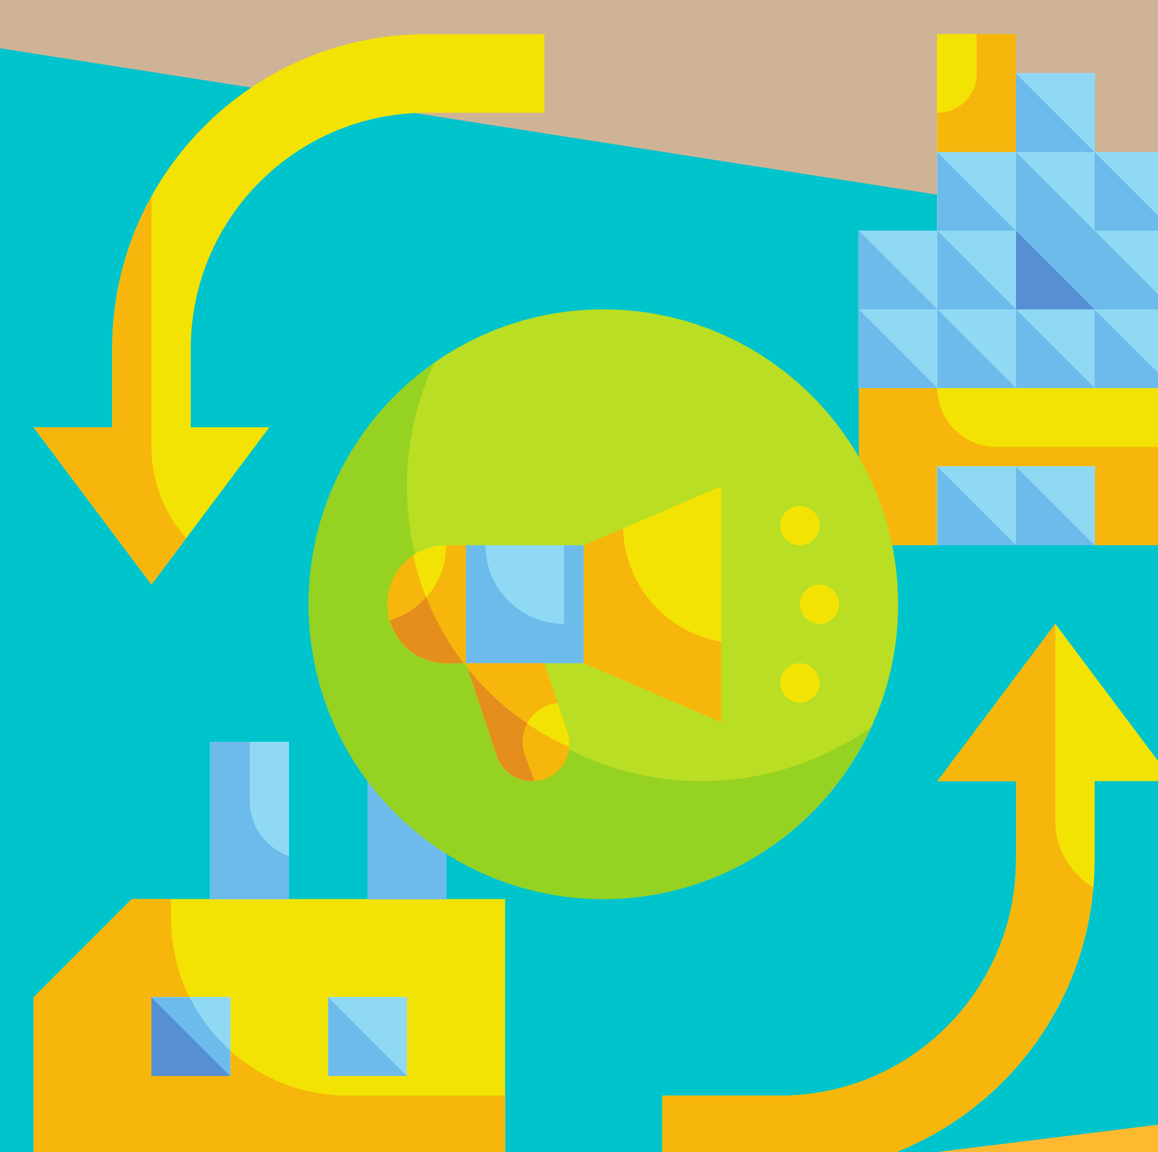
We connect companies with multiple quotes from qualified producers around the world. They send us back minimum 3 producers they are willing to work with.

Kannavis contacts producers to provide MOQ sample size :

1. **Company test multiple samples .** We ask the client to let us know which producers meet their companies expectations in product quality and pricing.

2. **Company send us order schedule**. We submit order schedules to producers and ensure they can meet companies demands.

3. **We have contracts signed from both parties.** Company signs with Kannavis to secure their order schedule with multiple producers chosen. The producer signs with Kannavis to "lock in" their sales channel. All parties are now contracted to meet their obligations.



All parties benefit from option contracts:

1. The **buying company** is now versatile as the market changes. This allows themselves to diversify their products for customers as demand changes, and they have a third party verification company (Kannavis) handling all contract details as they can focus on day to day operations.

2. **Producers** can secure contracts and expand their clientele portfolio onto the international stage. This allows them to focus on day to day operations as Kannavis "locks in" contracts for them from around the world.

3. **Kannavis** has now created a favourable networking system for all parties involved, and Kannavis expands their sophisticated model to other markets.
